Trust Award Best SIEM Solution

Winner Securonix for Securonix Next Gen SIEM

Infosec professionals understand that there really can be too much of a good thing. Too much data. Too many tools. Too many threat alerts, too many of which are false positives.

Securonix and its Next Gen SIEM product relieves the burden of “too much,” offering customers a single enterprise solution that churns through high volumes of data, using signature-less, behavior-based analyses to detect and prioritize the true threats to an organization. In so doing, Securonix reduces the number of security alerts by up to 95 percent, which saves time and resources because infosec professionals can respond to the highest risk events, not false alarms.

Leveraging the SIEM solution's comprehensive set of threat models, advanced analytics, and use of both supervised and unsupervised machine learning, customers can glean continuous, real-time security intelligence on internal users, systems and applications through context-based monitoring and up-to-date risk scorecards.

While the solution is often deployed as enterprise software, Securonix also offers its capabilities via MSSP partners and its cloud-based SaaS-only behavior analytics service – two options that make deployment more scalable.

Meanwhile, the cost remains reasonable because the price is contingent on the number of users, rather than volume of data logs, and also because it is deployed on commodity hardware. Indeed, customers typically see up to 70 percent savings when deploying the solution.

Other benefits that contribute to ROI include a reduction in the number of digital assets leaked or shared, better-educated employees, and time savings due to automation.
